

AUTISM: DIVERSITY AND DEVELOPMENT

What is Autism?

Autism refers to a range of neurological differences that may influence how a person interacts, communicates and processes the world around them.

Common Symptoms

Communication difficulties, repetitive behaviors, and social challenges are common, but vary in intensity and form.

Causes of Autism

It has a multifactorial origin, with genetic and environmental factors contributing, though there is no single identified cause.

Early Intervention

Early detection and proper therapy improve social and cognitive skills, promoting development and inclusion.
